

Misc. Inspection and Assemble

Stud Driver Work Table

EMC² manufactures assembly aids for most any manual assembly process including drilling, screwing, riveting and bonding. Lift assists, tool balancers and part holding fixtures with clamps can be designed to make the assembly process more consistent and error proof.

Checking/Inspection Fixtures

These products are usually simple fixtures with a variety of sensors for confirming the presence or absence of assembled components. Normally used as a back up to the operator inspection, these fixtures can prove to be invaluable when catching even a single missed component. EMC² can build these fixtures for any size part and can check for almost any type of component. This product is not designed to compete with a gauge fixture.
